Abstract

The [OpenObs](#) project, led by [Patrinat](#), was launched in September 2017, and the first version of this tool was released in October 2020. OpenObs is based on the [Atlas of Living Australia](#) platform, supported by the Global Biodiversity Information Facility ([GBIF](#)) community, particularly the Living Atlases ([LA](#)) collective.

OpenObs enables the visualization and downloading of observation data on species available in the National Inventory of Natural Heritage ([INPN](#)), the national platform of [SI NP](#) (Information System for the Inventory of Natural Heritage). It provides open access to non-sensitive public data and includes all available observations, whether they are occurrence or synthesis data.

As of July 2023, OpenObs has 134,922,015 observation records, and new data is regularly added (at least twice a year). Furthermore, the project is constantly evolving with new developments planned, such as a user validation interface and new cartographic tools.

We will present the architecture of this LA-based national biodiversity portal (Fig. 1), as well as its planned new functionality and development roadmap.
