Abstract

Background

Fungi play crucial roles in ecosystems and are among the species-richest organism groups on Earth. However, knowledge on their occurrence lags behind the data for animals and plants. Recent analyses of fungal occurrence data from Western, Central and Northern Europe provided important insights into response of fungi to global warming. The consequences of the global changes for biodiversity on a larger geographical scale are not yet understood. Landscapes of Eastern Europe and particularly of eastern Ukraine, with their specific geological history, vegetation and climate, can add substantially new information about fungal diversity in Europe.

New information

We describe the dataset and provide a checklist of aphylloroid fungi (non-gilled macroscopic *Basidiomycota*) from eastern Ukraine sampled in 16 areas between 2007 and 2011. The dataset was managed on the PlutoF biodiversity workbench (<http://dx.doi.org/10.15156/BIO/587471>) and can also be accessed via Global Biodiversity Information Facility (GBIF, parts of datasets <https://doi.org/10.15468/kuspj6> and <https://doi.org/10.15468/h7qtfd>). This dataset includes 3418 occurrences, namely 2727 specimens and 691 observations of fructifications belonging to 349 species of fungi. With these data, the digitised CWU herbarium (V. N. Karazin Kharkiv National University, Ukraine) doubled in size A most detailed description of the substrate's properties and

habitat for each record is provided. The specimen records are supplemented by 26 nuclear ribosomal DNA ITS sequences and six 28S sequences. Additionally, 287 photographs depicting diagnostic macro- and microscopic features of fungal fruitbodies as well as studied habitats are linked to the dataset. Most of the specimens have at least one mention in literature and relevant references are displayed as associated with specimen data. In total, 16 publication references are linked to the dataset. The dataset sheds new light on the fungal diversity of Eastern Europe. It is expected to complement other public sources of fungal occurrence information on continental and global levels in addressing macroecological and biogeographical questions.

Keywords

Basidiomycota, Agaricomycetes, diversity, checklist, wood-inhabiting fungi, ectomycorrhizal fungi, corticioid fungi, polypore fungi, substrate, dead wood, Kharkiv, Donetsk, Luhansk, Nature Reserve, National Park

Introduction

Fungi play crucial roles in ecosystems and are among the species-richest organism groups on Earth (Mora et al. 2011, Heilmann-Clausen et al. 2014, Peay et al. 2016). However, their occurrence has been poorly documented so far due to the difficulties of species detection, identification and delimitation. The situation is now rapidly changing due to substantial improvements in the methods used to identify and communicate the taxa of fungi (Köljalg et al. 2013, Hibbett et al. 2016). On the other hand, possibilities to digitise the taxon occurrences during the few last years have been additionally improved, providing great benefits for all biodiversity researchers including mycologists (Abarenkov et al. 2010, Senderov et al. 2016).

Europe is the continent with the most advanced knowledge of fungal diversity due to a long-standing tradition of mycological research (Dahlberg et al. 2010). In the last decades, numerous national projects documenting fungal diversity have been initiated. Furthermore, national efforts have been consolidated into the international projects. Such cooperation enables researchers to investigate important ecological questions, for example, species- and community-level responses of fungi to global warming (Andrew et al. 2016, Kauserud et al. 2012). Answering macroecological questions may be facilitated by broad spatial coverage of the dataset, as exemplified by "Climate Change Impacts on the Fungal Ecosystem Component" project ClimFun (Andrew et al. 2017). There is a place to further expand geographic coverage of successful projects such as ClimFun, but this requires filling sampling gaps and digitisation efforts for national datasets, especially from Eastern Europe. In this region, sparse data availability and accessibility generally result from low numbers of both professional mycologists and citizen scientists (Dahlberg et al. 2010).

The environment of eastern Ukraine (Kharkiv, Donetsk and Luhansk regions) offers a special possibility to study fungal diversity associated with woody plants. Severe continental climate substantially limits the distribution of forests on the local scale, resulting in forest patches of limited size. These "forest oases" are separated from each other by the steppe vegetation or human-managed lands (Popovych 1990). Unlike the other parts of Ukraine and Europe, the European beech and Norway spruce are totally absent in the forests, while pedunculate oak and other numerous deciduous trees form a forest canopy. A specific geological history of the region resulted in the development of forest habitats on chalk outcrops or sandy sediments which are unique on a European scale (Fedorova 1980, Onyshchenko et al. 2007, Didukh and Pashkevich 2003).

Fungal diversity of eastern Ukraine remains insufficiently known. The first scanty documentation of fungal occurrences dates back to the beginning of 19th century (Akulov et al. 2003). The first inventory, specifically focused on the region, was completed four decades ago (Wasser and Soldatova 1977). Less than a decade ago, we reported the results of aphyllophoroid fungi species inventories in several protected areas of eastern Ukraine (Ordynets and Akulov 2011, Ordynets and Akulov 2012, Ordynets et al. 2012, Ordynets et al. 2013). However, these were mostly species lists with sparse metadata, spread over several "floristic papers". This valuable information on fungal occurrences hardly meets the criteria of accessibility, reusability and sharing claimed for biodiversity data nowadays (Senderov and Penev 2016, Costello et al. 2013). Moreover, during the last four years, specimens collected by us were involved in a series of taxonomic studies and were re-identified. All the past and future identifications of the specimens represent valuable information which ideally should be easily updated and traced. Finally, the research area is affected by military activity for more than three years (Vasyliuk et al. 2015) and its preservation and accessibility for research in the forthcoming decades is questionable. Therefore, a proper preservation of the currently available data is required. In this data paper, we describe the effort of digitising and sharing the dataset of aphyllophoroid fungi in selected areas of eastern Ukraine according to the current standards of publishing biodiversity information.

General description

Additional information: The project focuses on the diversity of aphyllophoroid fungi. These fungi form neither an evolutionary nor an ecological group but are often targeted as a research object because of both strong taxonomic tradition and sampling convenience. During most of the 20th century, fungi with macroscopic fruitbodies were taxonomically classified according to their fruitbody morphologies. Several generations of mycologists were trained using the morphological classification of fungi. Though these morphological groups barely represent monophyletic taxa and are usually the result of convergent evolution (Hibbett 2007), the present-day identification keys for macrofungi for practical reasons are still compiled based on the principal fruitbody type (e.g. Bernicchia and Gorjón 2010, Kriegsteiner and Kaiser 2000, Ryvarden and Melo 2014).

Aphyllophoroid fungi represent those basidial macrofungi which do not develop gills or closed reproductive structures but have smooth, toothed, irregularly folded to poroid hymenophore and one-celled basidia. They were previously treated as a single taxonomic order but are now found among ca. 20 orders mostly of the class Agaricomycetes (Kirk et al. 2008, Hibbett et al. 2014). Aphyllophoroid fungi are among the best-known groups of fungi globally and especially in Europe (Bernicchia and Gorjón 2010, Ryvarden and Melo 2014). They comprise a highly diverse group both in terms of species richness and functional differentiation. They are the most important agents of wood decay globally (Stokland et al. 2012), but also include mycorrhizal species, plant pathogens and litter saprotrophs (Tedersoo and Smith 2013). In general, aphyllophoroid fungi are strongly dependent on woody plants in terms of nutrition and habitat.

Project description

Study area description: Within the project, we inventoried aphyllophoroid fungi on 16 sampling areas located in eastern Ukraine and covering parts of three administrative regions, namely Kharkiv, Donetsk and Luhansk. All sampling areas are located in the middle basin of Siverskyi Donets River, Black Sea basin and their geomorphology developed due to the erosive activity of the river on the massive Upper Cretaceous sediments. We focused on the inventory of the well-preserved areas. We carried out the inventory in two Nature Reserves, i.e. the most strictly protected areas according to the Ukrainian conservational legislation (3 sampling areas), one National Nature Park (8 sampling areas) and one Regional Landscape Park (one sampling area). Four areas had no protected status but were located close to the protected ones. The list of areas with their definition, short characteristics including protection status, links to the areas as PlutoF objects and visiting/sampling statistics are provided in the Table 1. Beside the text description, each area was captured in photographs viewable on the respective area page in PlutoF (see web links in Table 1)

The sampling areas lie in the East European Plain. The elevation varies between 35 and 220 m a.s.l. The Upper Cretaceous sediments (of a chalk and marl) form a series of hills along the right bank of the Siverskyi Donets River, often with outcroppings. Quaternary sediments were formed mostly on the left bank of the river as alluvial and massive sandy accumulations (Bondarchuk 1959). The soils vary according to the bedrock characteristics. On the products of eolation, the ordinary chernozems with medium humus contents were formed. Slopes of the river valley and ravines are covered with the leached sod-calcareous soils. The river floodplain is dominated by meadow chernozems. Alluvial sand accumulations of the second river terrace bear sod-podzolic soils (Didukh and Pashkevich 2003).

According to the Köppen climate classification, the region falls into the area of a cold forest climate with severe winters and dry, long and hot summers (Jylhä et al. 2010). Compared to the rest of Ukraine, here the climate has the most pronounced continental characteristics. The mean annual temperature is 7.5°C, with recorded minimum of -40°C (January) and maximum of 39°C (July). The average annual precipitation is 400–540

mm, while the evaporation is 580–650 mm. Up to 60 days per year with very strong hot dry winds are possible (Popov et al. 1968).

According to the classification of terrestrial ecoregions of the world, the study area belongs to the biome of temperate grasslands, savannahs and shrublands (Olson et al. 2001). It is also known as a steppe region (EEA 2015). In these conditions, the natural woody vegetation mostly represents forest patches of limited size. The few striking exceptions exist due to their proximity to the large Siverskyi Donets River, as well as hilly landscape. Two broadleaf forests (called Teplynska dacha and Maiatska dacha) are the largest forest massifs on the watershed in the Ukrainian steppe zone (Onyshchenko et al. 2007).

The pedunculate oak *Quercus robur* L. is one of the most important tree species in the area. In the forests on the watershed, this oak species is accompanied by *Fraxinus excelsior* L., *Tilia cordata* Mill., *Acer platanoides* L., *A. campestre* L., *A. tataricum* L. and *Corylus avellana* L. In the Siverskyi Donets floodplain, the oak forest grows mosaically with the forests composed of *Alnus glutinosa* (L.) Gaertn., various poplars (*Populus nigra* L., *P. alba* L. and *P. tremula* L.), willows (*Salix alba* L., *Salix fragilis* L.) and *Acer negundo* L. (Popovych 1990).

The massive sandy terrace of the Siverskyi Donets River is basically a habitat for the psammophytic grasses and herbs. However, there are numerous depressions which provide a suitable microclimate for the development of the wetland local forests (groves). The usual trees in these habitats are: *Betula pendula* Roth, *B. pubescens* Ehrh., *Populus tremula*, *P. nigra* and *P. alba*, *Alnus glutinosa* and *Crataegus* spp. The willow shrubby communities of *Salix acutifolia* Willd. and *Salix rosmarinifolia* L. are common in some localities (Popovych 1990). As a result of land-use in the 19th and 20th centuries, large areas of the sandy terrace are currently covered not by primary vegetation of psammophytic grasses and herbs, but by plantations of *Pinus sylvestris* L. However, some of these stands are about 200 years old and resemble natural forests. The true natural pine forests in the region are currently confined to the chalky outcrops with the sod-calcareous soils. These populations were treated in the past decades as a relict species *Pinus cretacea* Kalen. (Didukh and Pashkevich 2003, Fedorova 1980) currently regarded as a variety of Scots pine, *P. sylvestris* var. *cretacea* (Kalen.) Kom. (Gardner 2013).

Funding: The work of Alexander Ordynets and Alexander Akulov in eastern Ukraine was supported by the V.N. Karazin Kharkiv National University and Ukrainian Ministry of Education and Science Grant Number 0112U007570/16-16-13 “Biodiversity exploration as a base for the nature conservation network development in Ukraine”. Alexander Ordynets and Ewald Langer were supported by the University of Kassel and the programme LOEWE (“Landes-Offensive zur Entwicklung Wissenschaftlich-ökonomischer Exzellenz”) of the Hesse’s Ministry of Higher Education, Research and Arts within the framework of the Integrative Fungal Research (IPF) project (<http://www.integrative-pilzforschung.de>). The work of Alexander Ordynets on the molecular identification of Thelephorales was undertaken due to support from the European Social Fund’s Doctoral

Studies and Internationalisation Programme DoRa and hosted by the Chair of Mycology, Institute of Ecology and Earth Sciences, University of Tartu, Estonia.

Sampling methods

Sampling description: In 16 areas, we sampled living fungal fruitbodies according to the standards for macrofungi collecting (Lodge et al. 2004). We were interested in recording the majority of species from the local species pool. Therefore we sampled not within fixed areas, but covered larger areas by sampling along the forest paths. We were passing up to ten kilometres of forest paths per day. We spent more time at the points which visually harboured higher amounts and diversity of deadwood. Visiting and sampling statistics for each area are provided in Table 1.

If the species could be readily identified in the field, the occurrence was recorded without taking a specimen, i.e. as observation, except for the very first finding of the species during the field work. All fruiting bodies from a single woody substrate or growing in a single cluster on debris or litter were treated as a single individual. For the records on woody substrata (which prevail in the dataset), principal tree fraction, diameter class, decay stage, spatial location and presence/absence of the direct contact with soil were recorded. For all the records, plant species of the substrate as well as characteristics of forest habitat and mesorelief were described (Table 2). All collected data were uploaded and managed on the PlutoF platform (Abarenkov et al. 2010).

Quality control: One of the challenges in inventorying fungal diversity based on fruiting bodies is the temporal irregularity of fruiting. To reduce the bias associated with this phenomenon, within five years (2007–2011), we carried out 15 expeditions, usually making one expedition per season (spring, summer and autumn). The earliest and latest sampling dates were March 9 and November 22 respectively. Each expedition lasted as a minimum three and as a maximum seven days. Within a single expedition, we visited up to four sampling areas (see Table 1). Some areas could be visited only once. This may be acceptable in the case of aphyllorhoid fungi which, as opposed to other fruiting fungi, in general create more lasting fruitbodies.

Along with the specimens which were more or less easily identified, there were also collections whose identifications were verified by another expert or collections which we could identify to the genus level only. Wolfgang Dämon, Ivan Zmitrovich, Anton Shyriaev, Heikki Kotiranta, Masoomeh Ghobad-Nejhad, Philomena Bodensteiner, Sergey Volobuev, Viacheslav Spirin and Erast Parmasto kindly helped us in such issues. The names of the experts who verified or improved our identifications are provided in the pane "Identifications", fields "Identifiers" and/or "Remarks" on the respective specimen page as viewed in PlutoF. Additionally, each PlutoF observation linked to our dataset was verified by the platform developer as seen in the pane "Discussion" on the single observation page.

Step description: Noticeable specimens were photographed directly in the field or after drying in the laboratory. The micromorphology study of the dried specimens was performed under 1000× magnification using light microscopes Zeiss Primo Star (Carl Zeiss Jena GmbH, Jena, Germany) and Nikon Eclipse 90i (Nikon Corp., Tokyo, Japan). The specimens were examined in 5% aqueous potassium hydroxide solution, Melzer's reagent and 1% Congo red solution in concentrated ammonia (Ryvarden and Melo 2014). The main identification keys used were Bernicchia and Gorjón (2010), Köljalg (1996), Larsson (1992), Ryvarden and Melo (2014).

Geographic coverage

Description: The extent of all sampling areas covers about 180 km in the longitudinal and 60 km in latitudinal direction. The total area of study is 380 km².

Coordinates: 48.7175° and 49.29° Latitude; 36.91884° and 39.39385° Longitude.

Taxonomic coverage

Description: The dataset contains 3418 species occurrences. It has 2727 specimens and 691 observation records, containing 349 species of fungi from the phylum Basidiomycota. Additional 16 items have no specific epithet but only genus-level (in one case order-level) identification (Table 3).

Most of the species belong to subphylum Agaricomycotina, class Agaricomycetes and represent 14 orders (Agaricales, Atheliales, Amylocorticiales, Auriculariales, Cantharellales, Boletales, Gloeophyllales, Corticiales, Hymenochaetales, Gomphales, Polyporales, Russulales, Thelephorales and Trechisporales). One genus belongs to a separate lineage of presumably order level (*Xenasmatella* spp.) and five species have an unclear position within Agaricomycetes (three *Dendrothele* spp., *Granulobasidium vellereum* and *Trechinothus smardae*). Three species in the dataset represent the subphylum Pucciniomycotina: *Helicogloea farinacea* and *H. lagerheimii* (Atractiellales, Atractiellomycetes) and *Colacogloea peniophorae* (Microbotryomycetes).

The dataset includes several species described or raised to the species level status in the last two decades: *Antrodiella ichnusana*, *Lyomyces erastii*, *L. incrustatus*, *Phlebia tuberculata* and *Xylodon tuberculatus*. We could use these names for identification purposes by 2012, i.e. by the end of specimen identification phase of the project. However, to some specimens, new important identifications were added in the course of taxonomic revisions published after 2011 (Table 4). Further important recent nomenclatural innovations reflected in the dataset are treating *Tomentella crinalis* and *T. fibrosa* in the separate genus *Odontia*, following Tedersoo et al. (2014).

From 19 specimens representing 16 species, we generated 19 nuclear ribosomal DNA ITS sequences and four 28S sequences. Further seven ITS and two 28S sequences were produced in collaborative studies focusing on a particular taxonomic problem (see Table

4). The sequences can be found in the public repositories UNITE (Köljalg et al. 2013) and GenBank (Benson et al. 2013) and linked to the respective CWU vouchers in PlutoF. The sequence [UDB033929^{*1}](#) from specimen [CWU4336^{*1}](#) is the first barcode sequence for the species *Phellinus rhamni*. Our photographs of *Dichomitus squalens* ([CWU6509](#)) and *Lenzites warnieri* ([CWU6505](#)) linked to the dataset illustrate the respective species in the latest key to European polypores (Ryvarden and Melo 2014).

Traits coverage

The assignments to the 1) lifestyle and 2) fruiting-body principal configuration (morph) type were provided for each species. Lifestyle is a predefined field in PlutoF, from which we used the categories saprotroph, symbiotroph and parasite.

The principal fruitbody configuration of macrofungi is an increasingly addressed species trait in the ecological and evolutionary studies (Abrego et al. 2016, Hibbett 2007). We classified the species of our dataset into the following groups: those where fruitbodies have smooth spore-producing surface (corticiod), species with cup-shaped fruitbodies (cyphelloid), species with toothed hymenophore (hydnoid), species developing pores (poroid), species having gelified fruiting bodies (heterobasidial) and species having coralloid, club-like or funnel-like fruiting bodies which grow negatively geotropic (clavarioid). As the trait module for fungi in PlutoF is still under development (July 2017), we specified the fruiting body morph in the field "Identifications.Remarks" for each specimen and observation.

Temporal coverage

Data range: 2007-3-09 - 2011-5-07.

Collection data

Collection name: All the specimens are stored in the V.N. Karazin National University Herbarium, Kharkiv, Ukraine (CWU). Many specimens belonging to the order Thelephorales are recorded in PlutoF having their main deposition place as: University of Tartu; Natural History Museum and Botanic Garden; Botanical and Mycological Museum; Department of Mycology, TU(M). The duplicates of CWU specimens studied by colleagues were placed in the herbaria of their institutions: M.G. Kholodny Institute of Botany, National Academy of Sciences of Ukraine (KW), V.F. Kuprevich Institute of Experimental Botany, Belarus Academy of Sciences (MSK), V.L. Komarov Botanical Institute (LE) and Institute of Plant and Animal Ecology (SVER) of the Russian Academy of Sciences, University of Gothenburg (GB) and personal collections of Josef Vlasák, Wolfgang Dämon, Heikki Kotiranta and Masoomeh Ghobad-Nejhad (will join the Iranian Cryptogamic Herbarium, ICH).

Collection identifier: CWU, TU(M), KW, MSK, LE, SVER, GB, ICH.

Specimen preservation method: Fresh specimens were dried with an electric fan dryer on the day of collection and placed in grip seal plastic bags. Shortly after drying, the specimens were placed into a deep freezer (-20°C) for a week, to prevent their destruction by insects. Specimens are preserved in cardboard herbarium boxes.

Curatorial unit: CWU fungal specimens are curated by the Department of Mycology and Plant Resistance of V.N. Karazin Kharkiv National University, Ukraine.

Usage licence

Usage licence: Open Data Commons Attribution License

IP rights notes: The dataset is hosted by PlutoF and accessible from the latter under Attribution-NonCommercial-ShareAlike 4.0 International License (CC BY-NC-SA 4.0). The source records compiled into the dataset are available in the dedicated PlutoF project (<https://plutof.ut.ee/#/study/view/38925>). Project specimens and sequences are open for alternative taxon identifications. The occurrence records may also be viewed in the GBIF occurrence dataset of CWU herbarium (Savchenko 2017, <https://doi.org/10.15468/kuspj6>) and the GBIF dataset of PlutoF platform observations (PlutoF 2017, <https://doi.org/10.15468/h7qtfd>). All data resources are also provided in Suppl. material 1.

Additional information

Results communication

The results of species inventories in eastern Ukraine were communicated and discussed at several conferences and meetings attended by Alexander Ordynets and Alexander Akulov:

- Conferences for young scientists organised by M.G. Kholodny Institute of Botany, National Academy of Sciences of Ukraine (2008 in Kamianets-Podilskyi, 2009 in Kremianets, 2010 and 2011 in Kiev, Ukraine);
- Conferences for young scientists organised by V.N. Karazin National University in Kharkiv, Ukraine (2008-2011);

- Presentations on Ukrainian fungi at the Microbial Evolution Research Group, University of Oslo (2012-10-16) and Botanical Museum, University of Oslo (2014-03-27);
- Field course on identification of corticioid Basidiomycetes (2012-09-10 – 2012-09-15) and winter seminar (2013-02-25), organised by the Chair of Mycology, Institute of Ecology and Earth Sciences, University of Tartu, Estonia;
- Presentation on Ukrainian fungi diversity at the Department of Mycology, University of Marburg, Germany (2013-06-17).

Outlook

While uploading and processing our data in the PlutoF system, we found that some species were missing in the PlutoF classification. Therefore we added manually to the PlutoF taxonomy one genus (*Heteroradulum*) and the six following species: *Basidiobolus deminutum*, *B. rimulatum*, *Heteroradulum kmetii*, *Hyphodontia incrassata*, *Maireina maxima* and *Trechinothus smardae*. Two more species, *Sistotrema hauerslevii* and *Henningsomyces stipitatus*, were added to PlutoF classification by means of import from the GBIF Backbone Taxonomy of 2016. One plant species, *Prunus stepposa*, was also manually added to the Plantae kingdom of PlutoF taxonomy. These taxon additions will ease the data upload for subsequent PlutoF users.

Our data contribute to more than a doubling in size of the digitised CWU herbarium, the first and the largest digital collection outside Estonia hosted by PlutoF (Savchenko 2017). Our dataset sheds further light on the fungal diversity of Eastern Europe and it is anticipated that it will complement other data sources on European fungi in addressing macroecological and biogeographical questions. It is also hoped that the example of this data paper will promote further effective enrichment of PlutoF platform with fungal occurrence data.

Acknowledgements

We thank the administration and staff of the Luhansk and Ukrainian Steppe Nature Reserves, Sviati Hory National Nature Park and Valeriy Lovchinovskiy for immense help in organising field work. Irina Dudka and her colleagues from the Department of Mycology, M.G. Kholodny Institute of Botany provided comments at the designing phase of the project and Eugen Dykyi and Ihor Dzeverin commented on some preliminary results of data sampling. The voluntary help with the sampling and photographing specimens and sampling sites was provided by Olga Ternovska, Artem Bogatkov and Olena Bogatkova and occasionally by Oleg Prylutskyi, Iryna Kulyk and Eugen Nagornyi, all of whom are thanked for accompanying the team in the field. Kadri Pöldmaa kindly shared her experience of modern light microscopy. Leif Ryvarden, Nils Hallenberg and Tatiana Atemasova provided some literature relevant to the project. We are indebted to our colleagues who helped with specimens identification: Wolfgang Dämon, Ivan Zmitrovich, Anton Shyriaev, Heikki Kotiranta, Masoomeh Ghobad-Nejhad, Philomena

Bodensteiner, Sergey Volobuev, Viacheslav Spirin and Erast Parmasto. We thank Kessy Abarenkov, Allan Zirk and all other members of PlutoF team for help with data management. We thank editors and reviewers for the helpful comments on the manuscript.

Author contributions

Alexander Ordynets and Alexander Akulov are the main collectors of specimens and observations. Alexander Ordynets, Alexander Akulov, Eugene Yurchenko, Vera Malysheva, Urmas Kõljalg, Josef Vlasák, Karl-Henrik Larsson and Wolfgang Dämon identified the specimens. Urmas Kõljalg, Josef Vlasák, Karl-Henrik Larsson and Ewald Langer sequenced some of the specimens. Alexander Ordynets and Anton Savchenko uploaded data to the PlutoF workbench and further managed it. Alexander Ordynets wrote the first version of the manuscript and all co-authors contributed to the writing.

Table 1.

Definitions of 16 sampling areas in eastern Ukraine where aphyllophoroid fungi were inventoried, with number of visits and taxa occurrences recorded.

Sampling area name	Locality text	Region	Commune	URL to the area in PlutoF* ¹	Number of visits to area	Number of specimens collected	Number of observations
Ukraine, Iziumska Luka floodplain	Iziumska Luka Regional Landscape Park, floodplain of the Siverskyi Donets River	Kharkiv	Balaklea	https://plutof.ut.ee/#/area/view/1782438	2	588	25
Ukraine, Iziumska Luka sandy terrace	Large sandy massif to the east from Iziumska Luka Regional Landscape Park	Kharkiv	Balaklea	https://plutof.ut.ee/#/area/view/1782428	2	78	11
Ukraine, Yaremivka	Area between Siverskyi Donets River and railway Izium-Sviatohirsk, between "Bukino" and "Studenok" train stations, including the candidate protected area Yaremivskyi Preserve	Kharkiv	Izium	https://plutof.ut.ee/#/area/view/1782489	2	74	43
Ukraine, Sviatohirsk floodplain	Sviati Hory National Nature Park, floodplain to the south of Sviatohirsk town	Donetsk	Sloviansk	https://plutof.ut.ee/#/area/view/1782490	7	127	39

Ukraine, Sviatohirsk hills	Sviati Hory National Nature Park, high steep hills south of the Syverskyi Donets River	Donetsk	Sloviansk	https:// plutof.ut.ee/ #/area/view /1782491	4	75	34
Ukraine, Sviatohirsk sandy terrace	Sviati Hory National Nature Park, pinery with inclusion of deciduous forest patches to the north and east of Sviatohirsk town	Donetsk	Lyman	https:// plutof.ut.ee/ #/area/view /1782495	8	610	206
Ukraine, Teplynske	Sviati Hory National Nature Park, west of Bogorodychne village	Donetsk	Sloviansk	https:// plutof.ut.ee/ #/area/view /1782493	5	115	149
Ukraine, Maiatske	Sviati Hory National Nature Park, west of Maiaki village	Donetsk	Sloviansk	https:// plutof.ut.ee/ #/area/view /1782494	2	85	5
Ukraine, Drobyshivske	Sviati Hory National Nature Park, forest south-west of Drobshevo village	Donetsk	Lyman	https:// plutof.ut.ee/ #/area/view /1782496	3	52	110
Ukraine, Lyman sandy terrace	Sviati Hory National Nature Park, sandy terrace south of Lyman town (before 2016 named Krasnyi Lyman)	Donetsk	Lyman	https:// plutof.ut.ee/ #/area/view /1782498	1	23	0

Ukraine, Lyman floodplain	Sviati Hory National Nature Park, floodplain south of Brusivka and Dibrova villages	Donetsk	Lyman	https:// plutof.ut.ee/ #/area/view /1782499	1	6	0
Ukraine, Kreidova flora hills	Kreidova Flora, division of the Ukrainian Steppe Nature Reserve, vicinities of Kryva Luka village	Donetsk	Sloviansk	https:// plutof.ut.ee/ #/area/view /1782500	1	220	0
Ukraine, Kreidova flora floodplain	Floodplain of the Syverskyi Donets River near Kryva Luka village	Donetsk	Sloviansk	https:// plutof.ut.ee/ #/area/view /1782501	1	101	0
Ukraine, Trokhizbenka sandy terrace	Trokhizbenskyi Step division of the Luhansk Nature Reserve, north of Trokhizbenka and Kriakivka villages	Luhansk	Slovianoserbsk	https:// plutof.ut.ee/ #/area/view /1782503	1	136	52
Ukraine, Trokhizbenka floodplain	Floodplain of Syverskyi Donets River south of Trokhizbenka and Kriakivka villages	Luhansk	Slovianoserbsk	https:// plutof.ut.ee/ #/area/view /1782505	1	11	17
Ukraine, Stanychno- Luhanske	Stanychno- Luhanske division of the Luhansk Nature Reserve, east of Stanytsia Luhanska town	Luhansk	Stanytsia Luhanska	https:// plutof.ut.ee/ #/area/view /1782502	1	426	0

Table 2.

Substrate and habitat characteristics of fungal occurrence data recorded in the project.

Variable attribution	Variable	Number of categories	States of the variable
Substrate: all records	Plant species	56	
Substrate: records from wood	Principal tree fraction	3	branch; stump; trunk
	Diameter class	4	1 (<3 cm); 2 (3–10 cm); 3 (10–20 cm); 4 (20–30 cm)
	Wood decay stage	5	1–5 according to the degree of wood decay
	Spatial location of substrate	3	attached (including bark); detached (including snags and stumps); free
	Direct contact with soil	2	in contact with soil; not in contact with soil
Habitat	Forest spread type	5	continuous; focal; scattered; artificial pine forest; mixed forest
	Forest type, according to dominating tree species	6	alder, birch, oak, pine, spruce, larch
	Mesorelief type	6	floodplain, ravine, river bank, waterside, hill, plateau

Table 3.

Species checklist and frequencies of occurrence of aphyllophoroid fungi (phylum Basidiomycota) from insular woodlands of eastern Ukraine. Specific epithet is available for 349 taxa, while it could not be found for 16 items (only genus-level or order-level identification was possible)

Taxon name	Count speci-mens	Count obser-vations	Class	Order	Family	Genus
<i>Abortiporus biennis</i>	1		Agaricomycetes	Polyporales	Podoscyphaceae	Abortiporus
<i>Aleurodiscus dextrinoideocerussatus</i>	2		Agaricomycetes	Russulales	Stereaceae	Aleurodiscus
<i>Amphinema byssoides</i>	6		Agaricomycetes	Atheliales	Atheliaceae	Amphinema
<i>Amylorenasma allantosporum</i>	1		Agaricomycetes	Amylocorticiales	Amylocorticiaceae	Amylorenasma
<i>Antrodia albida</i>	2		Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodia gossypium</i>	9		Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodia hyalina</i>	13		Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodia malicola</i>	24	4	Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodia ramentacea</i>	4		Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodia sinuosa</i>	1		Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodia sp.</i>	1		Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodia xantha</i>	2		Agaricomycetes	Polyporales	Fomitopsidaceae	Antrodia
<i>Antrodiella faginea</i>	2		Agaricomycetes	Polyporales	Steccherinaceae	Antrodiella
<i>Antrodiella ichnusana</i>	1		Agaricomycetes	Polyporales	Steccherinaceae	Antrodiella
<i>Antrodiella romellii</i>	1		Agaricomycetes	Polyporales	Steccherinaceae	Antrodiella
<i>Aphanobasidium pseudotsugae</i>	2		Agaricomycetes	Agaricales	Pterulaceae	Aphanobasidium
<i>Aporpium canescens</i>	10		Agaricomycetes	Auriculariales	Auriculariales fam incertae sedis	Aporpium
<i>Artomyces pyxidatus</i>	5	5	Agaricomycetes	Russulales	Auriscalpiaceae	Artomyces
<i>Athelia acrospora</i>	2		Agaricomycetes	Atheliales	Atheliaceae	Athelia
<i>Athelia arachnoidea</i>	33	3	Agaricomycetes	Atheliales	Atheliaceae	Athelia
<i>Athelia bombacina</i>	2		Agaricomycetes	Atheliales	Atheliaceae	Athelia
<i>Athelia decipiens</i>	14		Agaricomycetes	Atheliales	Atheliaceae	Athelia
<i>Athelia epiphylla</i>	26		Agaricomycetes	Atheliales	Atheliaceae	Athelia

<i>Athelia fibulata</i>	3		Agaricomycetes	Atheliales	Atheliaceae	Athelia
<i>Athelia salicium</i>	2		Agaricomycetes	Atheliales	Atheliaceae	Athelia
<i>Athelia</i> sp.	11		Agaricomycetes	Atheliales	Atheliaceae	Athelia
<i>Aurantiporus fissilis</i>	2	1	Agaricomycetes	Polyporales	Meruliaceae	Aurantiporus
<i>Auriscalpium vulgare</i>	3	7	Agaricomycetes	Russulales	Auriscalpiaceae	Auriscalpium
<i>Basidiodendron caesiocinereum</i>	1		Agaricomycetes	Auriculariales	Exidiaceae	Basidiodendron
<i>Basidiodendron deminutum</i>	2		Agaricomycetes	Auriculariales	Exidiaceae	Basidiodendron
<i>Basidiodendron eyrei</i>	8		Agaricomycetes	Auriculariales	Exidiaceae	Basidiodendron
<i>Basidioradulum tuberculatum</i>	1		Agaricomycetes	Hymenochaetales	Schizoporaceae	Basidioradulum
<i>Bjerkandera adusta</i>	19	14	Agaricomycetes	Polyporales	Meruliaceae	Bjerkandera
<i>Bjerkandera fumosa</i>	2	1	Agaricomycetes	Polyporales	Meruliaceae	Bjerkandera
<i>Boidinia furfuracea</i>	1		Agaricomycetes	Russulales	Russulales fam incertae sedis	Boidinia
<i>Botryobasidium arachnoideum</i>	1		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium aureum</i>	2		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium candicans</i>	22		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium conspersum</i>	34		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium curtisii</i>	3		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium laeve</i>	12		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium pruinatum</i>	10		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium robustius</i>	8		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium simile</i>	1		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium sphaericosporum</i>	8		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium
<i>Botryobasidium subcoronatum</i>	46		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryobasidium

<i>Botryohypochnus isabellinus</i>	7		Agaricomycetes	Cantharellales	Botryobasidiaceae	Botryohypochnus
<i>Bourdotia galzinii</i>	1		Agaricomycetes	Auriculariales	Auriculariales incertae sedis	Bourdotia
<i>Brevicellicium olivascens</i>	1		Agaricomycetes	Trechisporales	Hydnodontaceae	Brevicellicium
<i>Bulbillomyces farinosus</i>	8		Agaricomycetes	Polyporales	Podoscyphaceae	Bulbillomyces
<i>Byssomerulius corium</i>	23	10	Agaricomycetes	Polyporales	Meruliaceae	Byssomerulius
<i>Ceraceomyces serpens</i>	12		Agaricomycetes	Polyporales	Meruliaceae	Ceraceomyces
<i>Ceraceomyces tessulatus</i>	3		Agaricomycetes	Polyporales	Meruliaceae	Ceraceomyces
<i>Ceratobasidium cornigerum</i>	10		Agaricomycetes	Cantharellales	Ceratobasidiaceae	Ceratobasidium
<i>Ceriporia purpurea</i>	19	1	Agaricomycetes	Polyporales	Meruliaceae	Ceriporia
<i>Ceriporia reticulata</i>	1		Agaricomycetes	Polyporales	Meruliaceae	Ceriporia
<i>Ceriporia viridans</i>	4		Agaricomycetes	Polyporales	Meruliaceae	Ceriporia
<i>Ceriporiopsis mucida</i>	1		Agaricomycetes	Polyporales	Steccherinaceae	Ceriporiopsis
<i>Ceriporiopsis resinascens</i>	3		Agaricomycetes	Polyporales	Steccherinaceae	Ceriporiopsis
<i>Cerrena unicolor</i>	8	3	Agaricomycetes	Polyporales	Cerrenaceae	Cerrena
<i>Chondrostereum purpureum</i>	10	13	Agaricomycetes	Agaricales	Agaricales fam incertae sedis	Chondrostereum

<i>Xenasmatella vaga</i>	5		Agaricomycetes	Agaricomycetes ord incertae sedis	Xenasmataceae	Xenasmatella

Table 4.

Re-identifications of the eastern Ukrainian fungal collections based on recent taxonomical revisions. For all such species, the specimens were studied and cited personally by the authors of the new names (but see comment for *Antrodia hyalina*).

Original identification	Current name	Reference
<i>Antrodia pulvinascens</i>	<i>Antrodia hyalina</i>	V. Spirin, personal
<i>Eichleriella deglubens</i>	<i>Heteroradulum kmetii</i>	Malyshева и Спирина
<i>Phanerochaete magnoliae</i>	<i>Phanerochaete cumulodentata</i>	Volobuev et al. 2011
<i>Phanerochaete sordida</i>	<i>Phanerochaete livescens</i>	Volobuev et al. 2011
<i>Rigidoporus crocatus</i>	<i>Rigidoporus pouzarii</i>	Vampola and Vlasáková

Supplementary material

Suppl. material 1: Data resources: Aphyllophoroid fungi in insular woodlands of eastern Ukraine

Authors: Alexander Ordynets, Anton Savchenko, Alexander Akulov, Eugene Yurchenko, Vera Malyshova, Urmas Köljalg, Josef Vlasák, Karl-Henrik Larsson, Ewald Langer

Data type: occurrences, links to multimedia

Brief description: Separate Darwin Core Archives for specimens and observations, plus shape files of sampling areas.
