Abstract

Background

Hypomyces is a large genus of fungicolous fungi, parasitising the fruiting bodies of Agaricales, Boletales, Helotiales, Pezizales and Polyporales. *Hypomyces* currently comprises of 147 species widely distributed in Australia, China, France, Germany, Italy, Japan, North America, Sri Lanka, Thailand and UK. Amongst them, 28 species have been recorded in China.

New information

Hypomyces pseudolactifluorum sp. nov., growing on the fruiting bodies of *Russula* sp. in subsect. *Lactarioideae* and collected from Yunnan, China, is described with illustrations and molecular phylogenetic data (combined ITS, LSU, *TEF1-α* and RPB2 sequence dataset). The new species is characterised by semi-immersed to immersed perithecia and fusiform, apiculate and verrucose ascospores. We also review the species diversity of the genus *Hypomyces* in China.

Keywords

Mycoparasite, species diversity, muti-gene phylogeny

Introduction

Fungicolous fungi are a large and diverse ecological group, currently containing more than 1500 taxa distributed in many lineages across the fungal kingdom (Pöldmaa 2011, Sun et al. 2019a). *Hypomyces* (Fr.) Tul. & C. Tul. is an important genus of fungicolous fungi and placed in the family Hypocreaceae (Hypocreales, Sordariomycetes, Ascomycota) (Hyde et al. 2020). *Hypomyces* was originally introduced as a subgenus of *Hypocrea* Fr. (Fries 1825) and then Tulasne and Tulasne (1860) revised it to a genus and designated *H. lactifluorum* (Schwein.) Tul. & C. Tul. from the USA as its type. *Hypomyces* parasitises the fruiting bodies of Agaricales, Boletales, Helotiales, Pezizales and Polyporales (Rossman et al. 1999, Tamm and Pöldmaa 2013, Sun et al. 2019a). *Hypomyces* is characterised by: superficial or immersed, spherical to ovate, pyriform, papillate and yellow, orange, tawny red or green perithecia in a subiculum; 8-spored, subcylindrical to cylindrical and with a thickened apical ascii; and ellipsoid, lanceolate, fusiform to navicular, 0-1-septate or rarely 3-septate, hyaline, spinulose or verrucose and smooth-walled ascospores (Rossman et al. 1999, Zeng and Zhuang 2015). Its allied genera include *Cladobotryum* Nees, *Mycogone* Link, *Sepedonium* Link and *Stephanoma* Wallr (Wijayawardene et al. 2017) and its asexual morphs are *Acremonium*-, *Dactylaria*-, *Papulaspora*-, *Trichothecium*- or *Verticillium*-like (Jaklitsch et al. 2006, Hyde et al. 2020). *Hypomyces* currently comprises of 147 species in Species Fungorum (<http://www.speciesfungorum.org/>, accessed in April 2020) and is widely distributed in Australia, China, France, Germany, Italy, Japan, North America, Sri Lanka, Thailand and UK (Zhuang et al. 2012, Rossman et al. 2013, Zeng and Zhuang 2016, Zare and Gams 2016, Lechat et al. 2017, Wei and Kirschner 2017, Sun et al. 2019a, Sun et al. 2019b, Zeng and Zhuang 2019). Amongst them, 28 species have been reported in China (Table 1).

Fungicolous fungi play important roles in the processes of the growths and degradations of their hosts. With the rapid development of mushroom industries, the fungicolous fungi on mushrooms have received more and more attention (Hyde et al. 2019). In this paper, we introduce a new member of fungicolous fungi, *Hypomyces pseudolactifluorum* sp. nov., on the fruiting bodies of *Russula* sp., collected from Yunnan Province, China. At the same time, we review the species diversity of the genus *Hypomyces* in China.

Materials and methods

Collections and Morphology

Hypomyces specimens, including their host mushrooms, were collected in an evergreen broad-leaved forest in Baihualing, Baoshan, Yunnan Province, China. The specimens, as well as collected host mushrooms, were placed on a piece of aluminium foil at first, then rolled the paper into a cylinder, twisted at the ends for sealing and lastly taken back to the laboratory for study (McKnight and McKnight 1997). Colour codes were recorded following those of Kornerup and Wanscher (1978). A Nikon Coolpix P510 camera was used to take

photos in the wild. Dried specimens were observed and photographed using an Olympus SZ61 stereomicroscope and a Nikon ECLIPSE Ni compound microscope fitted with a Canon EOS 600D digital camera. Measurements were made using the Tarosoft® Image Frame Work programme v.0.9.7. The colour change of the perithecial wall was tested using 5% potassium hydroxide (KOH). Type specimens are deposited at the Herbarium of Mae Fah Luang University, Thailand (MFLU) and the Herbarium of Cryptogams Kunming Institute of Botany, Chinese Academy of Sciences, PR China (HKAS).

DNA extraction, PCR amplification and sequencing

The genomic DNA was extracted from the dried materials using the CTAB method (Doyle 1987). Tissues from the ascocarps of parasitic fungi and fruiting bodies of the host mushrooms were used to extract DNA, respectively. Primer pairs ITS1F/ITS4 (White et al. 1990), LR0R/LR5 (Rehner and Samuels 1994, Vilgalys and Hester 1990), *TEF1- α* 983f/*TEF1- α* 2218r (Carbone and Kohn 1999, Rehner and Buckley 2005) and RPB2-5f/RPB2-7cR (Liu et al. 1999) were used for amplification of the ITS, LSU, *TEF1- α* and RPB2 gene regions.

PCR was performed in a 25 μ l reaction volume: 12.5 μ l Taq PCR Master Mix (Abmgood, Richmond, BC, Canada), 1 μ l forward primer, 1 μ l reverse primer, 1 μ l DNA template and 9.5 μ l ddH₂O. For ITS and LSU, PCR reaction conditions are: 8 min at 94°C, followed by 30 s at 94°C, 30 s at 52°C and 1 min at 72°C for 35 cycles and a final extension of 10 min at 72°C. PCR reaction conditions of *TEF1- α* and RPB2 are: 8 min at 94°C, followed by 1 min at 95°C, 45 s at 59°C for RPB2/55°C for *TEF1- α* and 1 min at 72°C for 35 cycles and a final extension of 10 min at 72°C. The PCR products were detected using agarose gel electrophoresis and, in the gel documentation system, clear bands were observed. Sequencing was performed by Sangon Biotech (Shanghai) Co. Ltd., PR China; partial impure products were purified using the Cycle-pure-kit (Omega, America) and then cloned into pClone007 Simple vector (TSV-007S from Beijing TsingKe Biotech). Twenty clones of PCR products of each gene were sequenced using the universal primer pairs M13-47/M13-48.

Sequence alignment and phylogenetic analyses

The parasitic fungus: *Hypomyces pseudolactifluorum* sp. nov.

Molecular phylogenetic trees were constructed using our sequencing results of *H. pseudolactifluorum* sp. nov. and the voucher sequences of their allies obtained from NCBI GenBank (Table 2). Two species of *Trichoderma*, *T. hamatum* (DAOM 167057) and *T. viride* (CBS 119325) were used as outgroup taxa. All sequences were assembled and aligned using MAFFT v6.8 (Katoh et al. 2005) and manually edited via BioEdit version 7.0.9 (Hall 1999). Four sequence matrices of ITS, LSU, *TEF1- α* and RPB2 genes, respectively, were compiled. The optimal substitution model for each gene dataset was determined using jModelTest2 under the Akaike information criterion (AIC) (Darriba et al. 2012). The results indicated that the GTR+I+G model (-lnL = 8658.2624) is optimal for the ITS dataset, as well as the TIM1+I+G model (-lnL = 4392.5417) for LSU, the TrN+I+G

model (-lnL = 5751.4959) for *TEF1- α* and the model SYM+I+G (-lnL = 6419.6669) for RPB2, respectively. Using the aligned sequence matrices, a combined gene sequence dataset (ITS, LSU, *TEF1- α* and RPB2, orderly) was assembled and aligned and was finally deposited in TreeBASE database (<http://purl.org/phylo/treebase/phylows/study/TB2:S26593?x-access-code=152eadfc2292343af7627cfad5c2946c&format=html>).

Maximum Likelihood (ML) analysis was performed using IQ-Tree (Nguyen et al. 2014, Chernomor et al. 2016) with the computing models listed above and a bootstrap test of 1000 replicates. Bayesian Inference (BI) analysis was carried out using MrBayes v3.2.6 (Ronquist et al. 2012). The TIM1 and TrN substitution models were replaced by the GTR model (Huelsenbeck and Rannala 2004). Four simultaneous Markov Chain Monte Carlo (MCMC) chains were run for random trees of 10,000,000 generations and were sampled by every 100 generations. The computing was stopped when the standard deviation of the split frequencies fell below 0.01 and ESS values > 200. Subsequently, phylogenetic trees were summarised and posterior probabilities (PP) were performed using MCMC by discarding the first 25% generations as “burn-in” (Huelsenbeck and Ronquist 2001). Gaps were treated as missing data. Phylogenetic trees were viewed in FigTree v.1.4.2 (<http://tree.bio.ed.ac.uk/software/figtree>).

The host mushroom: *Russula* sp.

Voucher sequences (ITS gene) for phylogenetic analyses of the host mushroom and its allies were obtained from our sequencing results and GenBank databases (Li et al. 2020) (Table 3). Five species of *Russula* subg. *Compactae*, *R. acrifolia*, *R. adusta*, *R. eccentrica*, *R. nigricans* and *R. subnigricans* were selected as the outgroup taxa. Sequence alignment and phylogenetic analyses followed those of the parasitic fungus above. ML analysis was performed using IQ-Tree with TVM+I+G model (-lnL = 5298.7964) (Nguyen et al. 2014, Chernomor et al. 2016). The ITS sequence matrix of the host mushroom and its allies were deposited in the TreeBASE database (<http://purl.org/phylo/treebase/phylows/study/TB2:S26693?x-access-code=2e445b17aebe1f93266051a8920ae62f&format=html>).

Taxon treatment

Description

Index Fungorum number: **IF557817**

Sexual morph. **Subiculum** light yellow (4A4–5) when fresh and pale orange, light orange to brownish-orange (5A3–4, 5C4, 6C6) after being dried, usually covering the pileus, stipe and deformed gills of the host mushroom. **Perithecia** aggregated, semi-immersed to immersed in subiculum, except for their erumpent papilla, yellowish-brown to dark brown (5E6, 6E6, 6F6–8), pyriform to subglobose, 262–484 × 136–284 µm; perithecial wall 12–25 µm thick, single-layer, cells 9–22 × 4–8 µm. **Papilla** prominent, 129–177 µm high, at base 135–284 µm wide. **Asci** 8-spored, cylindrical, 147–222 × 4–9 µm; apex thickened, 4.9–6.0 wide and 2.5–3.0 µm high. **Ascospores** uniserial and with ends overlapping, fusiform, 30–38 × 6–8 µm, single-septate, septum median and with dense verrucae and prominently apiculate, apiculi 4.5–8.0 µm long, straight or curved. **Asexual morph:** unknown. (Fig. 1)

Diagnosis

The new species is similar to *Hypomyces lactifluorum* on *Russula* and *Lactarius* spp. from North America (Rogerson and Samuels 1994), but has smaller perithecia and shorter asci. The main differences of the two species are compared in Table 4.

Etymology

Referring to the most closely-related species, *Hypomyces lactifluorum*.

Distribution

PR CHINA (Yunnan).

Host

On the fruiting bodies of *Russula* sp. that grew on the humus layer in an evergreen broad-leaved forest of a rainforest. The host mushrooms: basidiocarps medium-sized and infundibuliform, pilei 63–77 mm in diameter. As serious degradation has occurred, the colour and other characters of the host mushrooms cannot be determined. Molecular phylogenetic evidence indicates it is a *Russula* species.

Notes

Only sexual morph had been discovered on the hosts (*Russula* sp.) of the new species.

Analysis

Phylogenetic analyses

Parasitic fungus: *Hypomyces pseudolactifluorum* sp. nov

The combined ITS+LSU+*TEF1-α*+RPB2 sequence dataset (excluding the outgroup taxa) contains 3,262 characters (709 for ITS, 893 for LSU, 921 for *TEF1-α* and 739 for RPB2) from 56 *Hypomyces* species and two *Trichoderma* species. Amongst them, 2,246 characters are constant, 209 variable characters are parsimony-uninformative and 807 characters are parsimony-informative. The ML and BI analyses resulted in trees with similar topology and support values and the ML tree is shown in Fig. 2.

In the phylogenetic tree, the parasitic fungi MFLU 20-0265 and MFLU 20-0266 are clustered together and formed a distinct lineage with the same branch length and strong supportive values (MLBP = 100%, BIPP = 1), which support them to be conspecific. The parasitic fungi are closely related *H. lactifluorum* and they form a sister clade also with strong supportive values (MLBP = 100%, BIPP = 1). Comparing the gene sequences of the two species, there are 25 bp (4.3%) differences across 582 bp in ITS, 28 bp (3.2%) differences across 870 bp in LSU, 24 bp (2.6%) differences across 921 bp in *TEF1-α* and 24 bp (3.2%) differences across 739 bp in RPB2 (Suppl. material 1). Following the recommendations from Jeewon and Hyde (2016), we assign the parasitic fungi as *H. pseudolactifluorum* sp. nov.

The host mushroom: *Russula* sp.

According to the ITS phylogenetic tree of the host mushroom and its allies, the host mushroom (MFLU 20-0265) is clustered together with *Russula leucocarpa* (HGAS-MF 009910 and HGAS-MF 009916) (MLBP = 100%) in subsect. *Lactarioideae*. However, their

ITS sequences have 24 bp (3.5%) differences across 694 bp, which indicated they may be two distinct species. Due to lack of sufficient morphological evidence, the host mushroom was temporarily identified as *Russula* sp. (Fig. 3).

Discussion

Zeng and Zhuang (2016) described *H. amaniticola* on *Amanita* sp. and *H. completiopsis* and *H. yunnanensis* on *Boletus* sp., also from China. Though with similar colour and shapes of perithecia, the host of *H. pseudolactifluorum* sp. nov. is decidedly different from those of these three species. Furthermore, *H. pseudolactifluorum* sp. nov. (KOH^-) has smaller perithecia and larger ascospores than those of *H. completiopsis* (KOH^+) and *H. pseudolactifluorum* sp. nov. has larger perithecia, asci and ascospores than those of *H. amaniticola* (KOH^+) and *H. yunnanensis* (KOH^-). Unfortunately, these three species all lack molecular data.

With the rapid development of mushroom industries, fungal pathogens on mushrooms have received more and more attention (Hyde et al. 2019). The fungicolous fungi *Hypomyces* is an important group of mushroom pathogens. Many *Hypomyces* species, for example, *H. aurantius*, *H. perniciosus*, *H. rosellus*, *H. odoratus* etc., have all been recorded as the causes of Cobweb or Web bubble disease which seriously influence mushroom industries (Fletcher and Gaze 2007, Carrasco et al. 2017, Zhang et al. 2017, Zhang et al. 2017). *Russula* is the largest subgenus in agaric with approximately 800 species (Li et al. 2020) and many *Russula* species are important edible mushrooms. Since growing on *Russula* sp., *H. pseudolactifluorum* sp. nov., as well as *H. lactifluorum* from North America (Rogerson and Samuels 1994), could be one of the potential pathogens of some *Russula* species in Asia.

Figure 1.

Hypomyces pseudolactifluorum sp. nov.. a: The host mushroom (*Russula* sp.); b-e: Perithecia embedded in subiculum effused over the substratum; d-e: Median sections of an ascoma; f: Section of peridium; g-l: Asci with ascospores; m-t: Ascospores. Scale bars: a = 5 cm; b = 1 mm; c = 200 μ m; d, e = 100 μ m; f, g= 50 μ m; h - l = 20 μ m; m - t = 10 μ m.

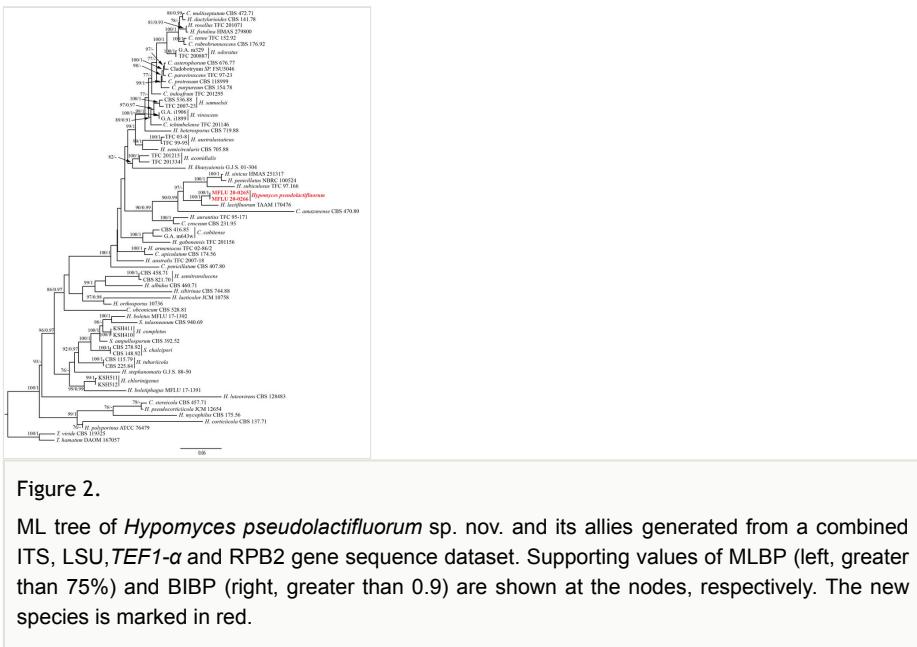

Figure 2.

ML tree of *Hypomyces pseudolactifluorum* sp. nov. and its allies generated from a combined ITS, LSU, *TEF1-α* and *RPB2* gene sequence dataset. Supporting values of MLBP (left, greater than 75%) and BIBP (right, greater than 0.9) are shown at the nodes, respectively. The new species is marked in red.

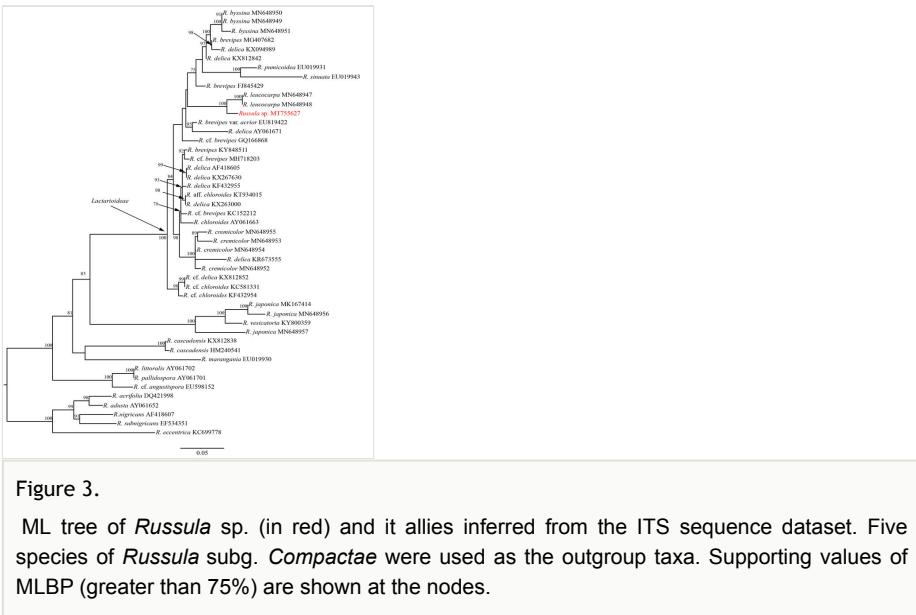

Table 1.

Species diversity of the genus *Hypomyces* in China (29 species in total).

Taxa names	Hosts	Distribution	References
<i>Hypomyces amaniticol</i>	<i>Amanita</i> sp.	China (Yunnan)	Zeng and Zhuang 2016
<i>H. aurantius</i>	<i>Agaricus bisporus</i> , Polyporales (<i>Cymatoderma</i> sp., <i>Laetiporus sulphureus</i> , <i>Panellus</i> sp., <i>Polyporus picipes</i>), <i>Stereum</i> sp.	China (Anhui, Fujian, Guangxi, Hainan, Hebei, Hunan, Jiangsu, Jiangxi, Shanghai, Sichuan, Zhejiang), New Zealand, USA	Chen and Fu 1989, Pöldmaa 2011, Luo and Zhuang 2012
<i>H. aureonitens</i>	<i>Phlebia tremellosa</i> , <i>Polyporus</i> sp.	China (Fujian, Guangxi), Europe	Teng 1963, Sun et al. 2019a
<i>H. chlorinigenus</i>	Agaricaceae, Boletaceae	Belgium, China (Taiwan), Guyana; Indonesia, New Zealand, USA	Rogerson and Samuels 1989, Zeng and Zhuang 2016
<i>H. chrysospermus</i>	<i>Boletus</i> sp., <i>Hemileccinum impolitum</i> , <i>Suillus americanus</i> , <i>Russula</i> sp.	China (Fujian, Jiling, Nanjing), Russia	Ma 2008, Luo and Zhuang 2012
<i>H. completiopsis</i>	<i>Boletus</i> sp.	China (Yunnan)	Zeng and Zhuang 2016
<i>H. fistulina</i>	<i>Fistulina</i> sp.	China (Guangxi)	Sun et al. 2019b
<i>H. hubeiensis</i>	<i>Agaricus</i> sp.	China (Hubei)	Zeng and Zhuang 2019
<i>H. hyalinus</i>	Agaricales (<i>Amanita</i> sp.), Polyporales	Canada, China (Jiangsu), Japan, USA	Teng 1934, Teng 1963, Rogerson and Samuels 1994
<i>H. lateritius</i>	<i>Lactarius camphoratus</i> , <i>L. chelidonium</i> , <i>L. controversus</i> , <i>L. deliciosus</i> , <i>L. sanguifluus</i> , <i>L. thejogalus</i> , <i>L. trivialis</i> , <i>Lactarius</i> sp.	Canada, China (Tibet), Europe, Japan, Mexico, New Zealand, USA	Rogerson and Samuels 1994, Luo and Zhuang 2012
<i>H. luteovirens</i>	<i>Russula atropurpurea</i> , <i>R. rosea</i> , <i>R. sanguinaria</i> , <i>Russula</i> sp.	Canada, China (Inner Mongolia), Europe, Japan, Russia, USA	Rogerson and Samuels 1994, Ma 2008
<i>H. macrosporus</i>	Russulaceae	China (Hubei), Mexico, USA	Rogerson and Samuels 1994, Luo and Zhuang 2012
<i>H. microspermus</i>	Boletaceae, <i>Boletus</i> sp., <i>Imleria badia</i> , <i>Xanthoconium affine</i> , <i>Xerocomellus chrysenteron</i> , <i>Xerocomus</i> sp.	Canada, China (Fujian, Guizhou, Hainan, Hubei, Jilin, Taiwan, Yunan), Indonesia, New Zealand, USA	Rogerson and Samuels 1989, Zeng and Zhuang 2016

<i>H. mycophilus</i>	<i>Auricularia</i> sp., <i>Bulgaria</i> sp., <i>Marasmius</i> sp., <i>Polyporus</i> sp., <i>Trametes versicolor</i>	China (Guangdong), USA	Rogerson and Samuels 1993, Zeng et al. 2017
<i>H. ochraceus</i>	Decaying leaves, wood and fungi (e.g. <i>Russula</i> sp.)	China (Guangxi, Yunnan), Europe, USA	Teng 1963, Sun et al. 2019a
<i>H. orthosporus</i>	Polyporales	China (Tibet), Estonia, Finland, The Netherlands	Pöldmaa 1996, Zeng and Zhuang 2019
<i>H. papulasporae</i>	<i>Geoglossum difforme</i> , <i>G. fallax</i> , <i>G. glabrum</i> , <i>G. nigrum</i> , <i>G. simile</i> , <i>Glutinoglossum glutinosum</i> , <i>Trichoglossum hirsutum</i> , <i>T. walteri</i>	China, USA, New Zealand	Rogerson and Samuels 1985, Sun et al. 2019a
<i>H. polyporinus</i>	<i>Auricularia auricula-judae</i> , Polyporales, <i>Trametes versicolor</i> , <i>T. pubescens</i> , <i>Polyporus</i> sp.	Canada, China (Guangxi), USA	Teng 1963, Rogerson and Samuels 1993
<i>H. pseudolactifluorum</i> sp. nov.	<i>Russula</i> sp.	China (Yunnan)	This study
<i>H. rosellus</i>	<i>Agaricus bisporus</i> , <i>Armillaria</i> sp., <i>Hydnellum</i> sp., <i>Hyphoderma</i> sp., <i>Mycena</i> sp., <i>Polyporus</i> sp., <i>Russula</i> sp., <i>Trichaptum</i> sp.	China (Gansu), Europe, Iran, Japan, Korea, USA	Tamm and Pöldmaa 2013, Sun et al. 2019b
<i>H. semicircularis</i>	<i>Ganoderma sichuanense</i> , <i>Microporus xanthopus</i>	Cuba, China	Wei and Kirschner 2017, Sun et al. 2019a
<i>H. sibirinae</i>	Aphyllophorales, <i>Boletus</i> sp., Polyporales	China (Hunan), Indonesia, USA	Samuels et al. 1990, Zeng et al. 2017, Sun et al. 2019a
<i>H. sinicus</i>	<i>Schizophyllum</i> sp.	China (Anhui)	Zhuang et al. 2012
<i>H. stephanomatis</i>	<i>Humaria hemisphaerica</i> , <i>Humaria</i> sp.	Canada, China (Hubei), Germany, USA	Rogerson and Samuels 1985, Zeng and Zhuang 2016
<i>H. subiculosus</i>	Polyporaceae (<i>Microporus affinis</i> , <i>Trametes versicolor</i>)	China (Anhui, Beijing, Guangxi, Zhejiang), Cuba, Japan	Rogerson and Samuels 1993, Luo and Zhuang 2012
<i>H. succineus</i>	<i>Pholiota</i> sp.	China (Taiwan), USA	Rogerson and Samuels 1994, Zeng and Zhuang 2016
<i>H. tegillum</i>	Aphyllophorales, Polyporales	Brazil, China (Guangxi, Yunnan), Panama, USA	Rogerson and Samuels 1993, Luo and Zhuang 2012
<i>H. triseptatus</i>	Bark or associated with an ascomycete; Pyrenomycete	China (Hunan, Guangdong), Gabon	Rossman and Rogersson 1981, Zeng et al. 2017

<i>H. yunnanensis</i>	<i>Boletus</i> sp.	China (Yunnan)	Zeng and Zhuang 2016

<i>Russula</i> sp.	MFLU 20-0265 (host)	MT755627	In this study

Table 4.Main differences between *Hypomyces lactifluorum* and *H. pseudolactifluorum* sp. nov..

	<i>H. lactifluorum</i> (Rogerson and Samuels 1994)	<i>H. pseudolactifluorum</i>
Subiculum	Pale yellowish-orange to bright orange (young), in age becoming deep red, reddish-purple to very dark purple (old), occasionally fading to pink, turning purple in 3% KOH.	Light yellow (4A4–5) when fresh, and pale orange to light orange to brownish-orange (5A3–4, 5C4, 6C6) after being dried, KOH (-).
Perithecia	Ovate to obpyriform, deep orange to reddish-purple, 400–600 × 200–450 µm	Pyriform to subglobose, yellowish-brown to dark brown (5E6, 6E6, 6F6–8), 262–484 × 136–284 µm
Embedded type	Immersed except for papilla	Semi-immersed to immersed except for papilla
Papilla	Averaging 120 µm high, 120 µm wide	129–177 µm high and 135–284 µm wide at base
Asci	Long cylindrical, 200–260 × 5–10 µm	Cylindrical, 147–222 × 4–8.5 µm
Ascospores	Fusiform, 1-septate, 35–40 × 4.5–7 µm	Fusiform, 1-septate, 30–38 × 5.5–8 µm
Apiculi	4.5–7.5 µm long	4–6 µm long
Hosts	<i>Russula</i> and <i>Lactarius</i> spp.	<i>Russula</i> sp.
Distribution	North America	P.R. China (Yunnan)

Supplementary material

Suppl. material 1: *Hypomyces pseudolactifluorum* sp. nov. (Hypocreales: Hypocreaceae) on *Russula* sp. from Yunnan, PR China

Authors: FENG-MING YU, RUVISHIKA S. JAYAWARDENA, JIAN-WEI LIU, KEVIN D. HYDE, QI ZHAO

Data type: word

Brief description: Sequence differences of ITS, LSU, *TEF1- α* and *RPB2* genes between *H. lactifluorum* (TAAM 170476) and *H. pseudolactifluorum* sp. nov.. The locus' numbers refer to the nucleotide positions of the gene sequences of *H. lactifluorum* from GenBank. Gap is replaced by '-'.
